In the original article by Gour [1], it was demonstrated that by accounting for a sublinear amount of energy as “free”, the athermality theory becomes reversible in the context of pure states. However, the article inaccurately contends that a proof for the mixed-state scenario remains elusive. Contrarily, the mixed-state situation can be derived from Theorem 1 in [2], provided one additionally assumes that the dimension of the SLAR is in proportion to the dimension of  $O(\sqrt{n \log n})$  qudits. To the best of the author’s understanding, it remains an unanswered question whether this dimension can be further reduced to a logarithmic scale, as accomplished in the original paper [1] for the pure-state scenario.

Furthermore, it’s important to highlight that conditions akin to those presented in Theorem III.2 of the original paper [1] were previously identified in [3], albeit in a slightly different context.
