A measurement of the $e^{+} e^{-} \rightarrow \rho \pi$ cross section at center-of-mass energies near the $J / \psi$ mass was reported by BES in Ref. [1].

One of the conclusions of the paper was that the BLT vector glueball model [2] explanation of the different $J / \psi$ and $\psi^{\prime}$ decay rates to $\rho \pi$ and $K^{*} K$ was ruled out. As pointed out in an analysis by Hou [3], this conclusion was unwarranted. No statistically significant distortion of the $\rho \pi$ curve is observed; however, this does not preclude the existence of a vector glueball state. The BLT model is not ruled out by this experiment.

## ACKNOWLEDGMENTS

We thank Wei-Shu Hou for bringing the error to our attention. We thank the staffs of the BEPC accelerator and the IHEP computing center for their assistance. The work of the BES Collaboration was supported in part by the National Natural Science Foundation of China under Contract No. 19290400 and the Chinese Academy of Sciences under Contract No. KJ85 (IHEP); by the Department of Energy under Contract Nos. DE-FG02-91ER40676 (Boston University), DE-FG03-92ER40701 (Caltech), DE-FG03-93ER40788 (Colorado State University), DE-AC02-76ER03069 (MIT), DE-AC03-76SF00515 (SLAC), DE-FG03-91ER40679 (UC Irvine), DE-FG03-94ER40833 (U Hawaii), DE-FG03-95ER40925 (UT Dallas), DE-AC3589ER40486 (SSC Lab); by the U.S. National Science Foundation, Grant No. PHY9203212 (University of Washington); and by the Texas National Research Laboratory Commission under Contract Nos. RGFY91B5, RGFY92B5 (Colorado State), and RCFY93-316H (UT Dallas).
