Equation (1) of the Letter,  $a_0 GM_b = V_f^4$ , only strictly applies in the limit of infinite distance from a point mass. Since flattened systems rotate faster than the equivalent spherical mass distribution, a factor of order unity is required to relate the acceleration measured in finite disk galaxies with  $a = V_f^4/GM_b$  to  $a_0$  as defined in MOND. The Letter omitted mention of this factor, which is empirically calibrated to be 0.8 such that  $a_0 = 0.8a$ . The measured  $a = 1.55 \times 10^{-10} \text{ ms}^{-2}$  was properly corrected to the reported  $a_0 = 1.24 \times 10^{-10} \text{ ms}^{-2}$ . Neither the results nor the conclusions of the Letter are affected by this omission.
