Khare and Sukhatme Reply The Comment by Jaworski and Lakshmanan [1] on our paper "Linear Superposition in Nonlinear Equations" [2] is both correct and appropriate. The linear superposition that we described in [2] does, in fact, seem to be a novel way of rewriting known periodic solutions using a different modulus parameter. Although the Jaworski and Lakshmanan approach in arriving at this result is somewhat different, we also arrived at the same conclusions recently [3,4]. It should be noted that what we [3] refer to as generalized Landen transformations [5] are essentially equivalent to Eq. (5) in the Jaworski and Lakshmanan Comment, although our expressions are more explicitly given in terms of Jacobi elliptic functions.
